The starting point for the derivation of new inventions is the loaded wire media: (a) a single wire with uniform periodic series loads, (b) a rectangular array of loaded wires, (c) loads are now defined as parallel-plate capacitors.

FIG. 5

Exploit the planes of physical symmetry to obtain electromagnetically equivalent structures: (a) the infinite wire media, (b) PPW structures of finite height. The supporting dielectric structure is not shown.

Alternative embodiments of PPW stop band filters: (a) Capacitive-loaded infinite wire media, (b) a PPW filter of finite height using internal capacitors, (c) PPW filters of finite height using external capacitors. The supporting dielectric structure is not shown.

Hybrid embodiments include combined internal and external capacitive loads. Dielectric cores are omitted for clarity.

FIG. 8

Elevation view of a square lattice of internal T resonant vias.

FIG. 9

Brillouin zone for a 2D periodic structure with a rectangular lattice of unit cell dimensions a x b in Cartesian coordinates.

FIG. 10

Dispersion diagram along the ΓX line for the capacitive-loaded wire media corresponding to the array of resonant vias shown in Figure 9. The stop bands are bracketed.

Tertiary	18.28	19.62	18.21	19.54

Comparison of stop band frequencies for the PPW filter shown in Figure 9.

FIG. 15

At lower frequencies around the first stop band, wave propagation along a principal axis, such as the x-axis, can be modeled using a simple transmission line circuit model.

FIG. 16

Examples of resonant via arrays with commensurate periods. Each is a PPW stoop band filter.

Transmission response (1901) for a TEM mode propagating in the x direction through the stop band filter shown in Figure 18. A -10 dB stop band is shown from 1.33 GHz to 10.0 GHz, a 7.5:1 ratio.

FIG. 19

Stop band filter embodiment \mathbf{EF}_{ext} is well suited for integration into existing PWB designs since it requires neither additional metal layers nor any additional thickness.
